

La Maison Dorée — reference capture

The client's benchmark. Captured 2026-09-05 at 430×932, iPhone UA, 2× DPR.

Live demo: <https://tdy-excellence-template.thedigitalyes.com>

Product page: <https://www.thedigitalyes.com/demo/maison-doree>

The `/demo/` URL is a marketing page with the template in a phone mock; the first URL is the template itself. Both are client-side rendered, so fetching the HTML returns nothing useful — it has to be rendered in a browser.

What is here

File	What
<code>01-cover.png</code> → <code>.webp</code>	The sealed-envelope cover, before any interaction
<code>02...12-scroll-*.webp</code>	The whole page, 8,051 px, in eleven frames
<code>type-and-palette.json</code>	Every distinct type style, the colour census, the loaded fonts, the page text
<code>assets.txt</code>	Every image and font URL the page requests

How to re-capture

The capture script is not kept in the repo because it is a one-off, but the two things that make it work are worth writing down:

1. **Block media.** The page pulls ~33 MB of video and `waitUntil: "networkidle"` never resolves. Use `domcontentloaded` plus a fixed wait.
2. **The cover is a hard gate.** It is a `div.fixed.inset-0` over `body{overflow:hidden}` whose only exit is a video that must play. With video blocked it never opens, so remove the overlay and restore `overflow` in the page context before scrolling.

What it actually uses

Type — both Adobe Fonts, downloaded in `public/fonts/`.

- **Parfumerie Script** — display: names at 60 px, section titles at 48 px.
- **Mrs Eaves** — everything else, including its small-caps, petite-caps and lining-figure variants.

We use Pinyon Script and EB Garamond, so change it.

Palette — a deep green `rgb(58, 85, 66)` doing almost all the work (224 occurrences), on an off-white ground `rgb(246, 244, 238)`. Our `--sage-deep`

is `#46543F = rgb(70, 84, 63)`, which is within a few points of theirs. The palette was never the gap.

Ornament — watercolour architectural and floral illustrations, one per section, as raster images. This is a large part of why it reads as expensive, and it is the thing we have least of.

Structure — 8,051 px tall. Cover, countdown, the celebrations, an itinerary, dress code, venue, hotels with prices, RSVP, gift registry, FAQ. Ours is much shorter, partly because the brief forbids several of those sections (no RSVP, no registry).

Where it conflicts with the original brief

Worth knowing, because the client has overridden the brief on several points and a future session should not "fix" these back without asking:

- The reference uses **ALL-CAPS tracked-out labels** everywhere (`VENUE`, `BOOKING LINK COMING SOON`, `Days` at 3 px letter-spacing). `CLAUDE.md` bans them.
- It joins meta strings with **middle dots** (`per night · double standard room · incl. taxes`). Also banned.
- It has an **RSVP** and a **gift registry**. The brief settles both as "not to be revisited".

Its actual faults, measured

Recorded in `docs/references.md` from the first capture, and still true:

- **47.9 MB** total, 33 MB of it video. Ours is ~220 KB.
- The countdown has **already expired** and reads `00 DAYS 00 HOURS 00 MINUTES`.
- An **untranslated i18n key**, `PROGRAM.CRUISESUBDESC`, is live on the page.
- The cover **cannot be escaped** if the video does not play: no skip, no label, no fallback, and `body{overflow:hidden}`.

Match its material quality and its motion. Do not match those four.
